

CYBERSECURITY BOOTCAMP

Your journey from beginner to cybersecurity specialist. Over the course of this bootcamp, you will evolve into a professional capable of identifying vulnerabilities, defending systems, and protecting digital environments from real-world threats.

DURATION**10 weeks****LEVEL****Beginner–Friendly****LANGUAGE****English (Arabic support)****FORMAT****In–Person, Kuwait****SCHEDULE****Evenings (Sun–Wed)****MODULE 1 · 01/03****2 Weeks**

■ Cybersecurity Foundations

This module builds a validated technical baseline by treating every topic as a cyber battlefield concept. Trainees operate from both attacker and defender perspectives from Day 1, moving through the full anatomy of a cyber attack, the Cyber Kill Chain, and the Incident Response lifecycle. They develop hands-on fluency across Windows log analysis, Kali Linux CLI, networking and traffic analysis with Wireshark, and web request manipulation with Burp Suite. The module then pushes into offensive territory — exploiting core web vulnerabilities including SQLi, XSS, command injection, and IDOR — while also covering AI prompt injection awareness, cryptography, and password cracking. Trainees must pass a Foundations Mini CTF to advance.

Cyber Kill Chain & Incident Response

CLI Fluency (Kali Linux)

Network Traffic Analysis

Web Exploitation Basics

Cryptography Fundamentals

MODULE 2 · 02/03**5 Weeks**

■ Offensive Security: Ethical Hacking & Pentesting

This phase builds structured Red Team capabilities, enabling trainees to simulate real-world offensive security operations end to end. Trainees conduct professional OSINT and active reconnaissance, exploit web applications through progressive custom labs, escalate privileges across Linux and Windows systems, execute complete Active Directory attack chains, and perform lateral movement and persistence. The phase also covers hybrid cloud offensive operations and AI-assisted reconnaissance, analysis, and reporting. It culminates in a hybrid enterprise Red Team simulation where trainees deliver a professional penetration testing report with a full attack narrative, structured findings, and clear risk prioritization.

OSINT & Reconnaissance

Web Application Exploitation

Privilege Escalation

Active Directory Attacks

Pentest Report Writing

■ Defensive Security: Blue Team Operations

This phase develops operational Blue Team capabilities, equipping trainees to function effectively within real-world security operations environments. Trainees operate within SOC workflows, triage alerts efficiently, investigate phishing campaigns, write and tune detection rules, and execute the full Incident Response lifecycle. They also conduct Windows, Linux, and network forensics, perform memory analysis, triage malware, run hypothesis-driven threat hunts, detect Active Directory abuse, and investigate hybrid cloud compromise — with AI integrated throughout. The phase culminates in a full hybrid Blue Team simulation, delivering a comprehensive incident response report with timeline reconstruction, root cause analysis, and detection improvement recommendations.

SOC Workflow & Alert Triage

Log Analysis & Detection Engineering

Digital Forensics (DFIR)

Threat Hunting

Incident Response Reporting
